1. Field of the Invention The present invention relates to a control apparatus for an engine of an automotive vehicle and, more particularly, to a control apparatus for an engine of an automotive vehicle, which detects the rotational position of a crankshaft of the engine based on an output of an output shaft of a transmission, and controls the ignition timing of the engine.

2. Description of the Related Art As shown in, for

example, Japanese Unexamined Patent Publication No. 62-98686, there has been developed an ignition timing control apparatus, which controls the ignition timing of an engine so that the engine rotational speed becomes equal to a target rotational speed in accordance with the traveling condition of an automotive vehicle, for improving the fuel consumption characteristic of the engine. In the ignition timing control apparatus, the rotational position of a crank shaft of the engine is detected based on an

output from a drive wheel pulley of a transmission. More specifically, the rotational position of the crank shaft is detected based on an output of an output shaft of the transmission, which is transmitted from the transmission to the drive wheel pulley. This makes it possible to eliminate the influence of a slip between the transmission and the drive wheel so that a so-called early-rotation slip can be prevented from being generated. However, in the ignition timing control apparatus, there is a case where the output of

the output shaft of the transmission changes in accordance with the rotational position of the drive wheel pulley of the transmission. For example, when the rotational position of the drive wheel pulley changes from a first predetermined rotational position to a second predetermined rotational position and when the rotational position of the crank shaft of the engine changes from a first predetermined rotational position to a second predetermined rotational position, a moment, which is directed to cause

an increase in the rotational position of the crank shaft, is given to the crank shaft. This change in the rotational position of the crank shaft causes a change in the rotational position of the output shaft of the transmission. Thus, it is difficult to accurately detect the rotational position of the crank shaft based on the output of the output shaft of the transmission. In particular, when the drive wheel pulley is switched from the first predetermined rotational position to the second predetermined rotational position, it

takes a relatively long time to rotate the output shaft of the transmission to the second rotational position. Thus, the rotational position of the crank shaft changes in accordance with the

Identification of a second T cell receptor (TCR)-V beta gene locus on chromosome 13q14. A gene complex encoding TCR-V beta 2 family determinants is found in the germline configuration on chromosome 13q14. This locus

consists of at least four genes, including TCR-V beta 2, TCR-V beta 6, TCR-V beta 12, and a new TCR-V beta gene, TCR-V beta 12-8, encoding V beta 8.2(dull). We identified a second TCR-V beta gene locus located on chromosome 13q14, and named it TCR-V beta 2.1. The gene that encodes this locus was separated from TCR-V beta 2 by 88-kilobase 5'-flanking DNA and introns of 22-22.5 kilobase. Like TCR-V beta 2, TCR-V beta 2.1 has five N-nucleotides and one insertion of three amino

acid residues and showed preferential expression in human fetal thymus and peripheral lymphoid organs. TCR-V beta 2.1-C beta 2 was transcribed in reverse complement, which may contribute to the specificity of recognition of antigen-specific T cells.
