AutoCAD has an “Import” button in the drawing workspace and all palettes and toolbars. From that menu, you can select Import, Import/Markup and Import/Markup – Edit. Import is the easiest to use and most commonly used option. Import/Markup is for sending large volumes of feedback to your designer. Import/Markup – Edit is a more complex option to incorporate edits into the drawing. We recommend using Import/Markup – Edit as the default import/markup function. It can save significant time if your feedback is the design in its final version. The Import button has a slightly different functionality in the two categories. We recommend using the Import button instead of the Import/Markup – Edit button in the Drawing Workspace. Import will import a.dxf file, import/markup will import a.pdf or.cdr file. The Import button will also mark any text you select with a red “Import Text” tag. Note: If you click “Markup” after Importing, the “Markup” or “Import Text” tag will turn green instead of red. This is a reminder that the feature is on. Line Construction: The new Line Construction feature makes it much easier to connect (snap) two or more lines. Quickly snap two or more lines together by first selecting the two points you want to connect and pressing the Line Construction button. A line will appear between the two points where you can drag and turn the line to align it. Pressing the Line Construction button again will switch the line to the Align tool. Align Objects: Two new commands have been added to the “Align” tool. These commands snap the current object to a point on a selected line or line segment. To align an object to a line or line segment, select the line or line segment and press the Align To button on the “Align” tool. Snap to Line (more accurately, split to line): When you click to select an object to be snapped to a line, by default the object is aligned and snapped along a line that is parallel to the current viewport. Now you can have the object snap to a line or line segment, which is orthogonal to the current viewport. To do so, select the line or line segment you
