----- The AutoCAD RIB Toolbox Add-on for AutoCAD R15 is a source file created by Autodesk. The source file contains all the drawing objects required for developers to customize and extend the RIB Toolbox add-on for AutoCAD R15. History In the first release AutoCAD (R15) software version (9.0) many of the functions that are built into the core software were already present. Since that release, new features have been added such as the ability to drag and drop in the ribbon and other more advanced workflows, multi-threading, new coordinate systems, etc. 2011 In 2011, there was some concern that the memory size of the operating system could be exhausted with AutoCAD using the new 64-bit version. This was remedied through a.NET optimization that addressed the problem. 2012 AutoCAD 2012.1 brought more built-in AutoLISP, VBA, and Visual LISP interfaces for developers to customize their own add-ons. 2014 AutoCAD 2014.1 has a new API for programmers which lets them develop their own extensions and add-ons. The new API is called XRL (Extensions for Add-ons for Rapid Loading) which makes it possible to

quickly create add-ons. These are available through Autodesk Exchange App store. 2015 AutoCAD R15 uses AutoLISP for customization and extension. 2016 AutoCAD R15 RTB has support for DXF import and export of drawings. 2018 AutoCAD 2018 is the latest release. There are four major components, namely the RST (Ribbon Standard Toolbar), IDC (Integrated Development Environment), RIB (Ribbon), and FLEX (Flexibility Manager). IDC is an API that developers can use to create their own extension, and it is now possible to create add-ons for AutoCAD which are available through Autodesk Exchange App store. In addition, the RST is improved, and the RIB now has a new look and is faster. 2019 AutoCAD 2019 was released on March 26, 2019. It is said to make AutoCAD more powerful than ever before, by optimizing ca3bfb1094

Q: Which is the simplest, most efficient, way to filter an XDocument? Here's the XDocument class: [XmlRoot("root")] public class CustomerOrder { [XmlElement("row")] public List Orders { get; set; } } As you can see, it has a list of Orders, and we need to filter this list based on a number of conditions. What is the most efficient way to do that? I came up with these three ways, but none of them seem to be the best: 1) LINQ to XML (but seems not so good, since I have a list of Items): foreach (var item in itemList) { XDocument document = XDocument.Load(item.FileName); var filtered = from o in document.Root.Elements("row") where o.Element("subType").Value == "B" select o; } 2) LINQ to XML (but seems not so good, since I have a list of Items): var element = "row"; foreach (var item in itemList) { XDocument document = XDocument.Load(item.FileName); var filtered = from o in document.Root.Descendants(element) where o.Value == "B" select o; } 3) Linq to XML (but seems not so good, since I have a list of Items): var element = "row"; foreach (var item in itemList) { XDocument document = XDocument.Load(item.FileName); var filtered = from o in document.Root.Descendants(element) where o.Value == "B"
