If you know the answer to that question, then you know the answer to this question. Validate..As a starting point, every neuron contains an axon, an elongated extension of the cell body, into which dendrites, or branched tips of cell body extensions, project. Each neuron carries electrical messages from one neuron to another in the form of an electrical current. The electrical current causes an electrical voltage wave in a receiving neuron. The shape of that voltage wave has been correlated with the type of neuron receiving it. For instance, the shape of the voltage wave generated by a particular neuron reflects the type of information, if any, that the neuron is processing. Thus, the voltage wave can be used to classify neurons into different groups corresponding to the neurons' types. In theory, the voltage wave generated by a neuron can be measured using a voltammetric technique. This technique typically involves placing the back of a single neuron's cell body between two electrodes, and measuring the electrical voltage between the electrodes as the neuron transmits an action potential along its axon. The voltammetric technique permits characterization of the voltage wave's shape and provides a useful classification of the neuron. In practice, while voltammetric e79caf774b
