I would like to print a float in a file, and then re-open the file with the same program and see if it still contains the float. If I open the file in a text editor and print the float, it works. But if I do it in a program, it doesn't. #include int main() { char ch; float myfloat; FILE \*fout = fopen("test.txt", "w"); while((ch = fgetc(stdin))!= EOF) { myfloat = ch; fprintf(fout, "%f", myfloat); fprintf(fout, "%f", myfloat); fprintf(fout, "%f", myfloat); fseek(stdin, 0, SEEK\_CUR); } fclose(fout); return 0; } Here, I see that the float is printed, but when I open it with the same program I wrote, it prints the number again. I have tried a few different things, like: fprintf(fout, "%f", myfloat); and it doesn't work. It gives an error. When I use std::stringstream instead of fprintf, I am able to save the float in the file, but it's a string, and not the float in the file is binary, not text. Printing out binary data may or may not display what you expect. The most common cause of this is that the computer has no idea how to decode your data, and so treats it as simply text.
