Download EZB Systems.Genomic clustering of genes involved in protein metabolism in the fission yeast Schizosaccharomyces pombe. The Schizosaccharomyces pombe genome contains a set of homologs to the Saccharomyces cerevisiae Genes Involved in Protein Metabolism (GIM) genes. In S. cerevisiae, at least 19 GIM genes exhibit known functions in protein quality control and amino acid utilization. We report here the genomic distribution of each gene in the S. pombe homologs and their allelic variants, and demonstrate that 19 genes are clustered with a 4 kb intergenic DNA segment. The presence of gene synteny between S. pombe and S. cerevisiae suggests that the origin of this cluster had occurred early in the evolution of the fission yeast. Several of the S. pombe gene products contain the conserved amino acid sequence motifs which were defined by the S. cerevisiae GIM genes.The Age of Trump and the Importance of Truth "The age of truth is over. The age of illusion has begun." — Will Durant So much has happened since my last post that I have been finding it very difficult to take it all in. A lot of the emotions, reactions, and opinions that I had been holding inside have run free. I have written some truthfully heartfelt posts, and so much has been said by others that I felt compelled to write yet another one. So, I think I need to just take it all in and be grateful for the past three years. I was preparing for a post on the Green Party, which I plan to share with you soon. The Green Party is where I learned what it was like to be an independent thinker, an individual, and a passionate activist. I thank my ancestors for teaching me the ways of liberty through these tumultuous times. I would love to have a full meeting with the Green Party about this or any other post that I had planned on writing
