Recently, to achieve further high-speed, high-volume printing, an electrophotographic image forming apparatus has been introduced which adopts a so-called contact charging method for electrically charging a surface of a photosensitive member on which a toner image is to be formed. The contact charging method includes a roller charging method of passing a charging roller as a charging means in sliding contact with or in close vicinity to a photosensitive member so as to uniformly charge the surface of the photosensitive member by an electrical field formed between the charging roller and the photosensitive member, and a blade charging method of applying a potential of a prescribed polarity to the surface of the photosensitive member by use of a blade portion having a certain curvature, which is pressed against the surface of the photosensitive member. The roller charging method has, for example, problems of wearing of the charging roller resulting from the sliding contact with the photosensitive member, degradation of the surface of the charging roller, and contamination of the photosensitive member with a charging agent. The blade charging method has, for example, problems of a complex arrangement of the blade portion. Recently, an image forming apparatus capable of charging with a high voltage has been known. The high-voltage charging tends to cause degradation of the surface of the photosensitive member and contamination of the photosensitive member with a foreign substance, such as, ozone or a corona product, which may degrade the toner image formed by development. A potential-varying charging device has been proposed which uses both of the advantages of the contact charging method, and the advantages of the charge method using a static-charge-applying conductor (Japanese Patent Application Laid-Open Publication No. 10-48646). The above-described prior art has an effect of reducing the potential variations at a development section by applying the charge with a high electric potential at an upstream side of the development section, and simultaneously applying the charge with a low electric potential at a downstream side of the development section. As a result, the charge with a uniform potential is applied to the 6d1f23a050
