In general, these are good prices, and they ship really, really fast. This isn't a bad deal, and it's very worth the $199 asking price if you need to use an integrated scanner that natively saves in PSD. If you want more software, consider grabbing copy of Photoshop or Lightroom. So, would I recommend this solution? In order to answer that question, you need to know a little bit about the hardware involved. First off, the (fairly) new(ish) Panasonic LUMIX TZ35 with the Hybrid Auto-Focus port can run just about all of the nice features in this handheld system, and the dial on the back makes switching between modes a matter of seconds. As far as it's image quality, I can honestly say it's above average to great; the images I shot in the streets of San Francisco have stayed with me for years. As far as professional grade, it's not there. In spite of the 12MP sensor, the color and contrast aren't good enough to compete with high-end prosumer and pro cameras. It's a whole different ballgame when you're talking about a $1,200 professional-grade system that can render megapixel-resolution images on screen. You're not going to find this in the flip-phone market – obviously. But if you're like a typical photographer and you work in JPGs, like a typical Mac user, and like your photos on the web, I think you'll be impressed with what you can do with this little camera. It's completely capable of rendering beautiful portraits, nature shots, street photos, and close-ups – all without a tripod. And it's also exceeding the functionality of its paid counterparts like the Lumia 520 and even the

Filter presets are no longer locked to an individual layer, so you can add the same split and glow effects to a group of layers. And you can now apply the same filter and enhance their effects using the "Live Filters" option. Through the new "Image Smooth and Sharpen" option you can get Photoshop Elements to subtly blur and sharpen your images for more natural-looking effects. Photoshop now supports interactive UI design, which allows you to design your own interface in Photoshop. The best part about this feature is that you can even apply it to the Vector tool, so you can immediately see the edits you have made in any view. Photoshop is also able to support copies of the same graphic file simultaneously (up until now, you had to apply a copy of the same thing at the same time). The new Camera RAW feature allows RAW images to be imported and edited with Targeted Adjustments, which intelligently choose what adjustments to make to achieve the exact look you want from your image. If you are working in the RAW media format, you are already using Camera RAW in your editing workflow, but this update brings you that feature in a new context and with added support for layers. One of Photoshop's greatest strengths, color refinement, has now received an overhaul. Adobe reckons it's the one area where it is most in need of improvement, and Photoshop has aways had a weakness with representation of colors and gradients. It's been revamped to support machine learning so that you can apply techniques to color correction that it's never been able to do before. This will allow you to adjust all of your images to look super realistic.
