Automatic keystone correction makes no sense. The original point of the keystone correction feature was to correct an autocorrected image and prevent the rendering of ugly jagged lines. The automatic keystone correction sometimes places those lines on an image (most often, a vertical one, so tilted), in another place altogether – sometimes even in the opposite vertical direction. The only real reason I can think of that Photoshop would automatically correct keystoning is if your image was distorted. If that's what you want, change the distortion direction after autocorrecting the keystone. Let's face it, Photoshop wouldn't have an automatic keystone correction feature if it viewed the idea of a grade-school student who drones on and on about this subject as some silly social media faux pas. Once the PSD is created, make sure that you connect to an Internet connection. Then fire up Photoshop and save the PSD file. Once you've downloaded Photoshop you open your saved file. The file will be extracted to your download folder and opened. It may take a minute or so depending how large the document is. Once opened, tap on Edit, then Undo. The last edits I made will be reapplied, but the last Undo will appear as a dialog box. Tap OK to exit the Undo window and you will return to your original document. Make Lightroom faster with the Photos tab on demand, integrated Alpha Channel optimization, and improved performance. One of the simplest things you can do for your edit is set up a perspective grid. Photoshop makes it easy to create a perspective grid from a selection or a selection made with smart objects. With a perspective grid, you can easily use the grid instead of the rotation tool for some of the rotational adjustments of your image. To use this feature, click the Perspective tab in your editing window and check the Create Perspective Grid checkbox. Photoshop's have a lot of power, so you'll want to turn on the Debug Brush, and use the switch at the bottom of the window to let you switch between

regular and soft brush modes. This will help you create more realistic artistic styles and other effects. Now that you've set up your perspective grid, you want to set some key points for your image. What points do you want to use for your grid? To do this, click the Background Point Tool and move the selected points that you want to use. In order for your points to stay in place, you'll have to switch to the Expert mode (you can find the toggle at the bottom of the window). Once you are in Expert mode, you will be able to style an object with the cursor and the object will stay in place as you reposition it on the grid. You can also add multiple points and use them for multiple layers of edits. You can also set the grid itself to a grid style and turn off the grid. To set your points, you simply move them around the screen using the Background Point Tool and reposition them using the arrow keys. When you are finished using your grid, you can reposition the points and re-save them using Layer>New Layer or simply X out of the layer. e3d0a04c9c
