The whole week I've been busily downloading the latest offer of Garth Graefin's newest free Lego Videogame Mocap Game, thanks to a movie which was released May 24th, 2012. I'm having the most of this new free Lego Videogame as my passion in the modeling business requires a lot of Mocap. For the adventure was to learn more how to use Mocap software, I've been studying the net and have read this website on Lego Videogames and so far I'm really keen on the Lego Videoga... In the first part of my Photoshop CS6 Review, I had listed edit modes, shortcuts and even effects that I use the most. In the second part, I will try and give you more detailed information, focusing on the improvements in the Field selection tools and the improvements in spot tools. I'll explain those to you in detail this week. Today I'm going to talk about Layer. I will show you to preview all the layers that I have and I highlight the layers that are on top of the others. What is very important in Photoshop is that all layers, even if you create a new one, are on top of the other. I have in the next future a little how to video that is really easy to understand about the layer concept. This concept in Photoshop is new for me in the past versions. Just so many interesting things in this CS6 version, from the ease of the retouching/repairing areas or the capture of historic images, as well as the fact that it is one the most popular photo editing tools in the world. The fact that Adobe offers the capability of importing into this CS6, photoshop brushes, is something that I believe to be quite telling by itself. At the moment, the new features continue to be added to the new application. While I focus on the capabilities that I use quite often, I do warn you that, as a lover of many programs, I have downloaded quite probably, another set of applications. So there's a very good chance that I will compare where the new CS6 may add more or less a little to other applications, either your own, or that you may already have in your computer.

I generally use Photoshop because it's integrated with Lightroom. I like how the workflow is built into the program. And since you can use Lightroom to do a lot of the "heavy lifting" of my workflow, I can take advantage of Photoshop to do the more intense editing. There is no replacement for Photoshop and ideally you will want to be able to use it for a wide variety of file types. But what if you are just doing some editing outside of that in case you need to delete a file? What if you need to use it to make a chart? Maybe you need to larger or smaller an image. Neither Lightroom nor Photoshop is the right answer for those tasks. Lightroom is great for cropping and making a selection and some basic edits. Photoshop gives you the power to do all those in one place and make corrections with presets, levels, and curves. If needing to create a new collection then export then you need Lightroom. If needing to make adjustments elsewhere in Bridge there's still Photoshop. But if you are wanting to make adjustments in document have the option to export everything. I like to have my photos in either Lightroom provides me with everything I need for print portfolios, family, and senior portraits. I know I am not alone in this desire for Lightroom. I love how quickly and fluidly it allows me to process images and create stunning content. The workflow is also much more automated than with Photoshop which I particularly enjoy. What set this up for me was the fact that I came from a wedding photography background and so Lightroom is very similar in workflow to the way I did weddings. It takes so much out of the way for me to see the images. From the moment I open it, I am working with them. I can take a sneak peek for similar images as I browse and view them in my long list of collections. Once I make my selection, I can move forward with my workflow.
